

## **Product Architect Intern (AI-Powered Products)**

*Build Products. Shape the Future. Learn from Founders.*

Are you a student who dreams in APIs, thinks in user stories, and plays around with LLMs just for fun? Want to work directly with founders and build products from scratch - from prompt to prototype?

We're looking for a Product Architect Intern who can help us design, storyboard, and build end-to-end products powered by Large Language Models (LLMs).

### **What You'll Do**

- Ideate, define, and document user stories for AI-powered products.
- Design product flows, mockups, and journeys with clarity.
- Collaborate with engineers to turn LLM prompts into real-world tools.
- Create product prototypes using tools like Figma, Notion, or low-code platforms.
- Explore APIs from OpenAI, Anthropic, and others to craft smart features.
- Test, refine, and improve product experiences based on user feedback.

### **What We're Looking For**

- You're currently pursuing a degree in Computer Science, Product Design, or similar.
- You've tinkered with ChatGPT, Claude, or LangChain — maybe even built a small tool.
- You love breaking down vague ideas into clear, buildable steps.
- You're curious, self-driven, and hungry to learn and ship fast.

### **Bonus If You Have:**

- Experience with prompt engineering or chaining LLM responses.
- Used tools like Figma, Framer, Bubble, or Replit.
- Build projects on your own - even if they failed, we want to hear about them.

### **What You'll Get**

- Stipend + Certificate + internship goodies + potential PPO (Pre-Placement Offer) for standout performers.
- Flexible working hours and the possibility of remote work
- Mentorship from product and tech founders.
- A front-row seat to how AI-native products are imagined and shipped.
